1 Project 1 - Udacity DSND

For this project the following libraries have being imported

```
In [1]: #Importing libraries
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
```

I have selected the Seattle AirBNB Dataset (<https://www.kaggle.com/airbnb/seattle/data?select=listings.csv>)

```
In [2]: # Gathering data
df = pd.read_csv("listings.csv")
```

```
In [4]: # Overview dataset
df.head()
```

```
Out[4]:
```

Missing Data:

The dataset indeed presents missing data. I have decided to not proceed with data cleaning since the data take for this notebook contains all the data without missing data. Based on the following there are several missing data but this does not impact my questions so I have left these unchanged.

```
In [11]: df.count().sort_values(ascending=True)
```

```
Out[11]: license          0
         square_feet      97

```

1.0.1 Question 1

What is the proportion of room_type per property_type?

As we can see below from the plot, there are 3 categories of room_type: * Entire home/apt * Private room * Shared room

On the other hand, there are 16 different property_type, however for this exercise I have selected the top 5: * House * Apartment * Townhouse * Condominium * Loft

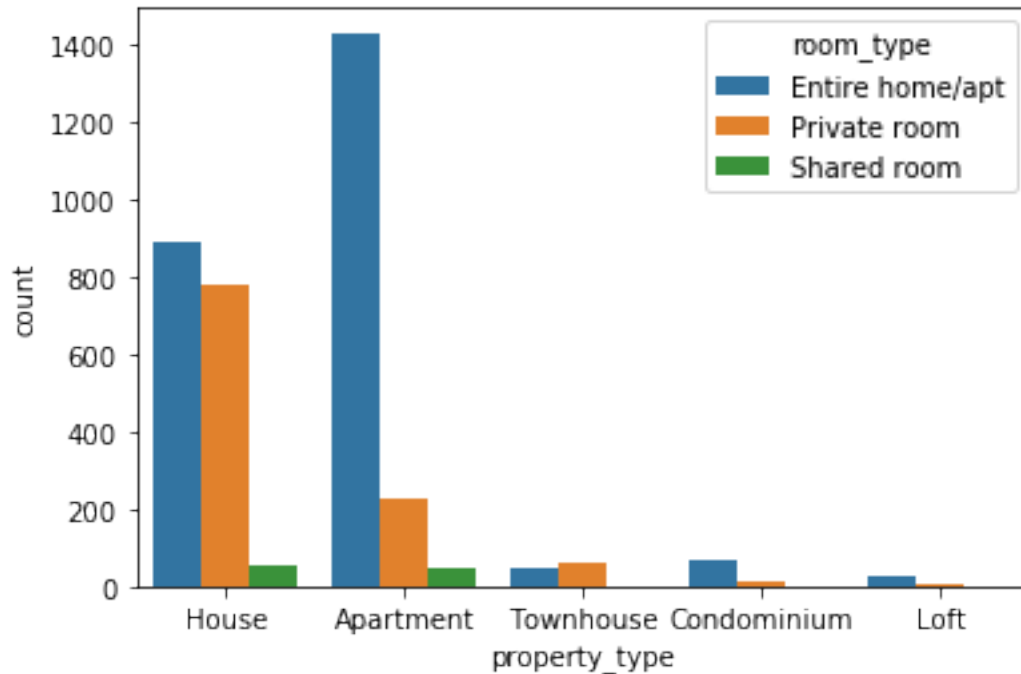

Following observation from the plot: * **House** (property_type) tend to have similar percentages of **Entire home/apt** (room type) and **Private room**(room type) * **Apartment** (property_type) has greater percentage of **Entire home/apt** (room type) compare to **Private room**(room type) * **Townhouse** (property_type) has greater percentage of **Private room** (room type) compare to **Entire home/apt**(room type) * **Condominium** (property_type) has greater percentage of **Entire home/apt** (room type) compare to **Private room**(room type)

Regarding **Shared Room**, there is a low percentage so it is not useful to discuss this

```

In [12]: # Counting instances in order
order = df['property_type'].value_counts(ascending=False).index[:5]
#Plot
sns.countplot(x="property_type", hue="room_type", data=df, order=order)
#Plot Show in notebook
plt.show()

```

1.0.2 Question 2

Who is the host in the dataset which posses the highest number of properties?

Steps and answer: * I have found below the number of properties per host * Got the first and highest host possessing greater number of properties (8534462) * Filtered data on host_id = 8534462 * Identified and reported properties the host is placing on AirBnB * Her name is Daniela and owns 46 properties.

```
In [14]: # Count of distinct host_id
         df['host_id'].value_counts()
```

```

1.0.3 Question 3

Which property on the selected database has the worst rating?

Steps and Answer: * Create copy of interested columns * Dropped NA values * Plotting BoxPlot showing distribution of values * Identified one property having rating about 20 * Sorted ascending by rating column and identified the worst rating and id of the property * Filtered property id on original dataframe * The property_id on dataset with the worst rating is 9183838

```
In [26]: # removing missing data from review_scores_rating
reviewdf = df[['id', 'review_scores_rating']].copy()
reviewdf.dropna(inplace=True)
```

```
In [27]: #Counting missing values
